

Computer Organization and Assembly Language – ENCS336

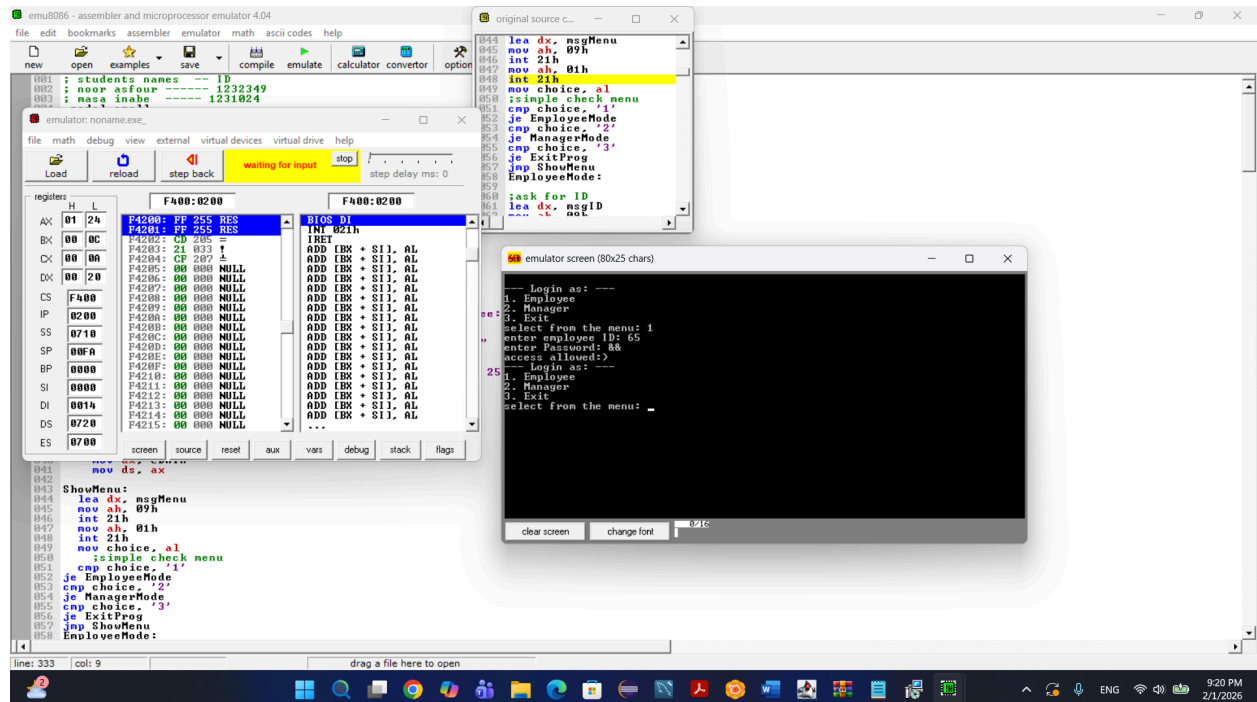

8086 Assembly Assignment

Instructor:
Abualseoud Hanani

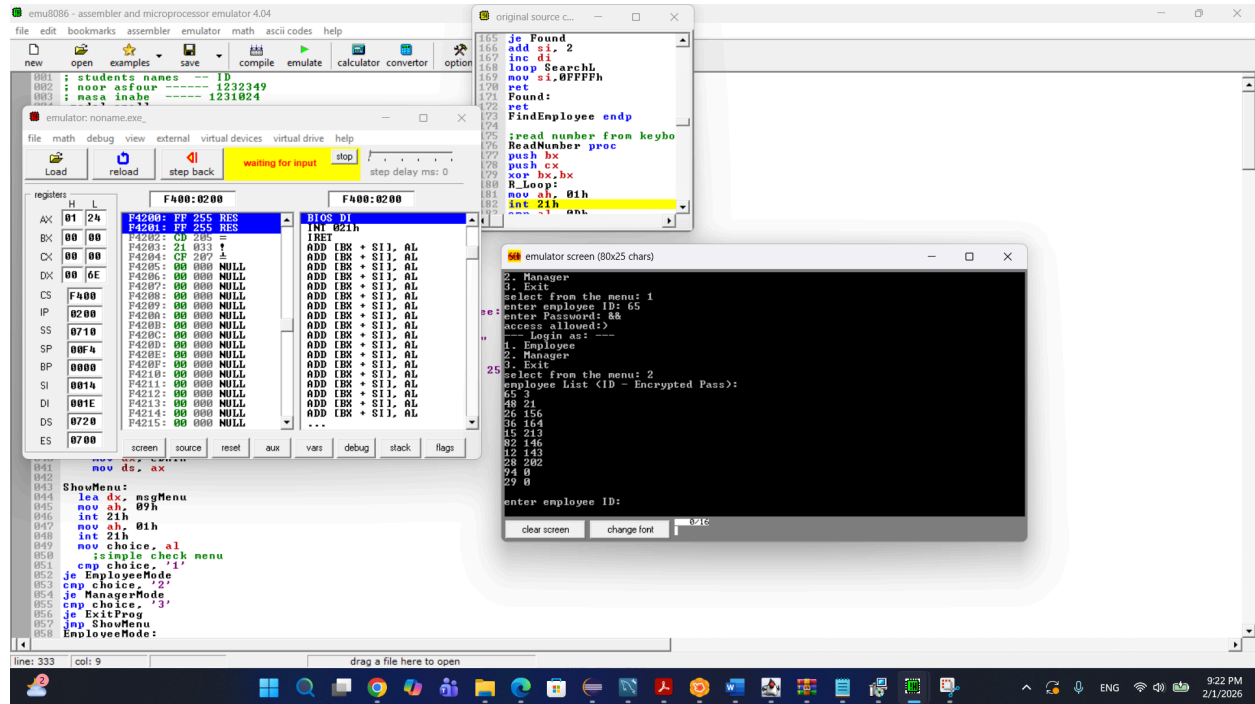

Students name & ID :
Noor Asfour - 1232349
Masa Inabe - 1231024

1. Choose from the menu , then enter employee ID and employee password:

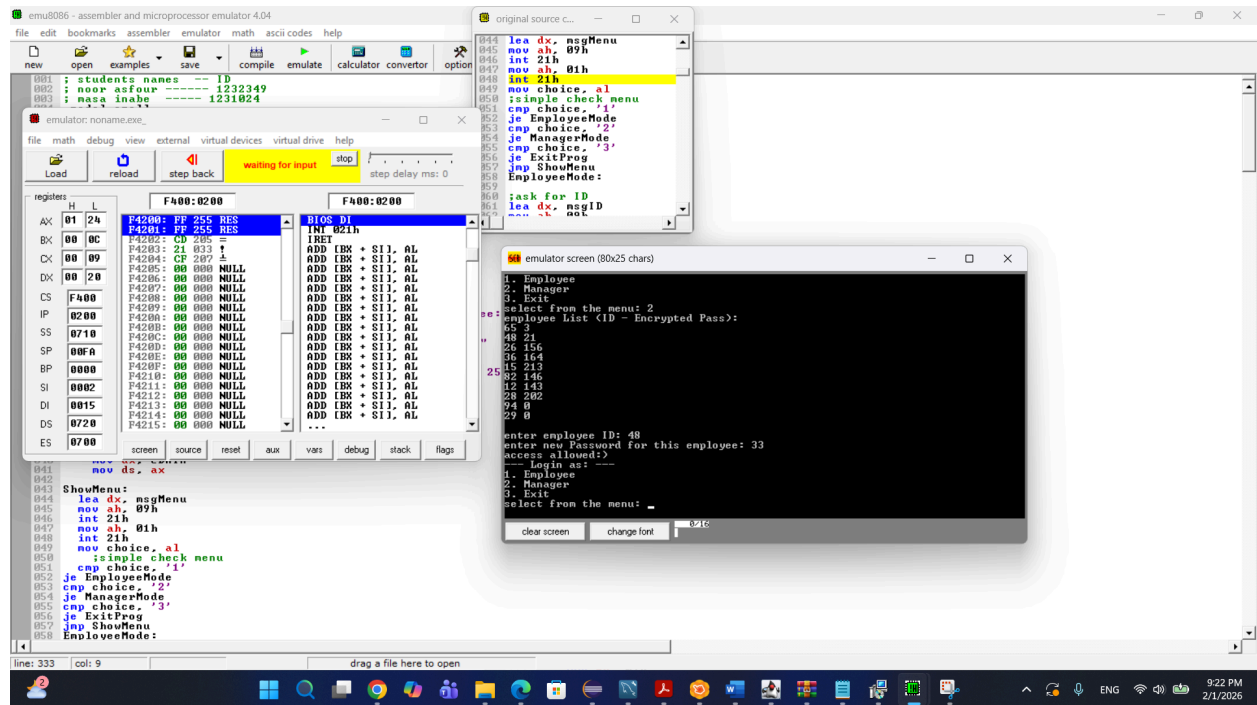

Employee password is hidden with & char

2. After we finish the employee task, the menu will automatically appear again. Then we will choose the manager to change the employee password.

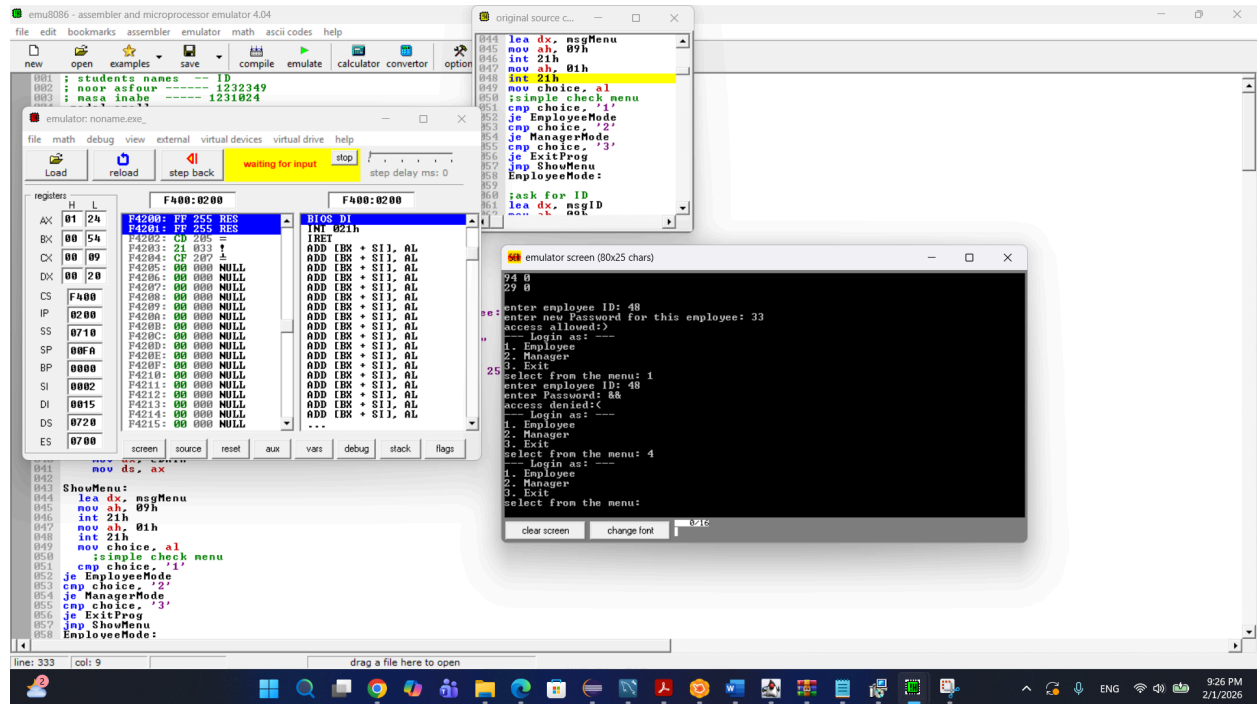

Here, the manager changed the employee password.

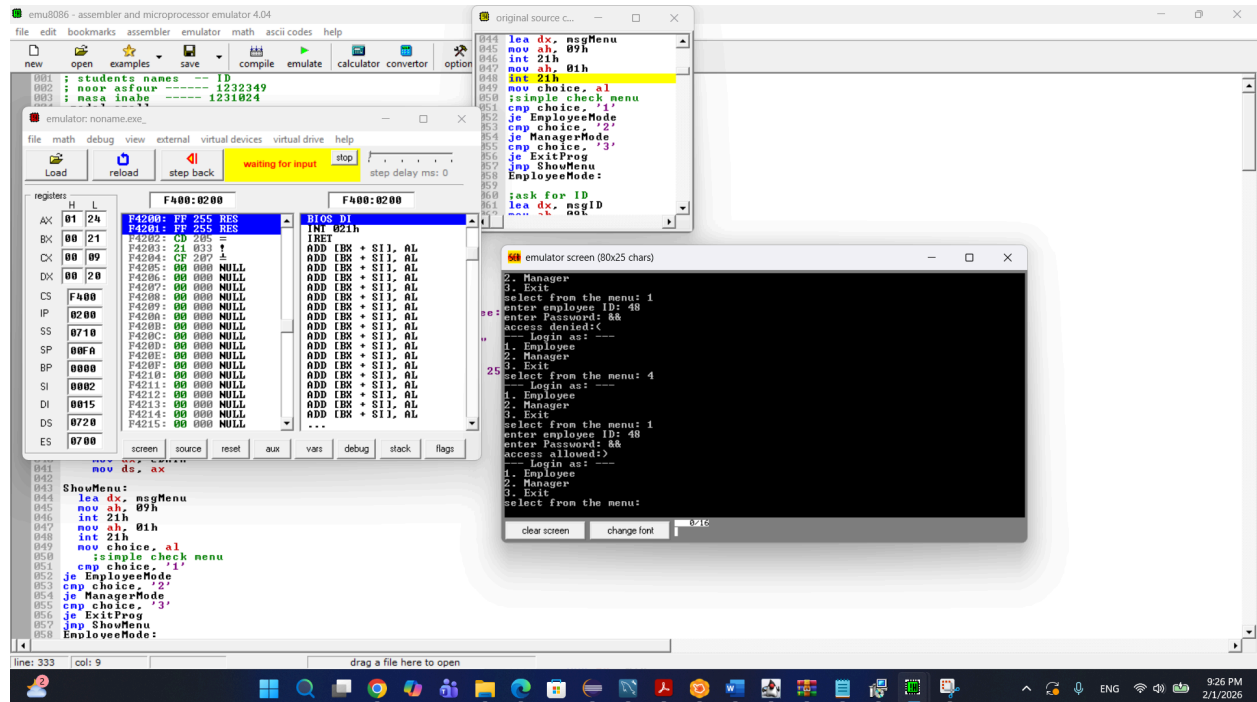

Note: it was changed in the code, when manager write the new password it hides it with & char same as when employee trying to login with his password

3. We changed the password,so we went to check if the new password log into the account successfully.

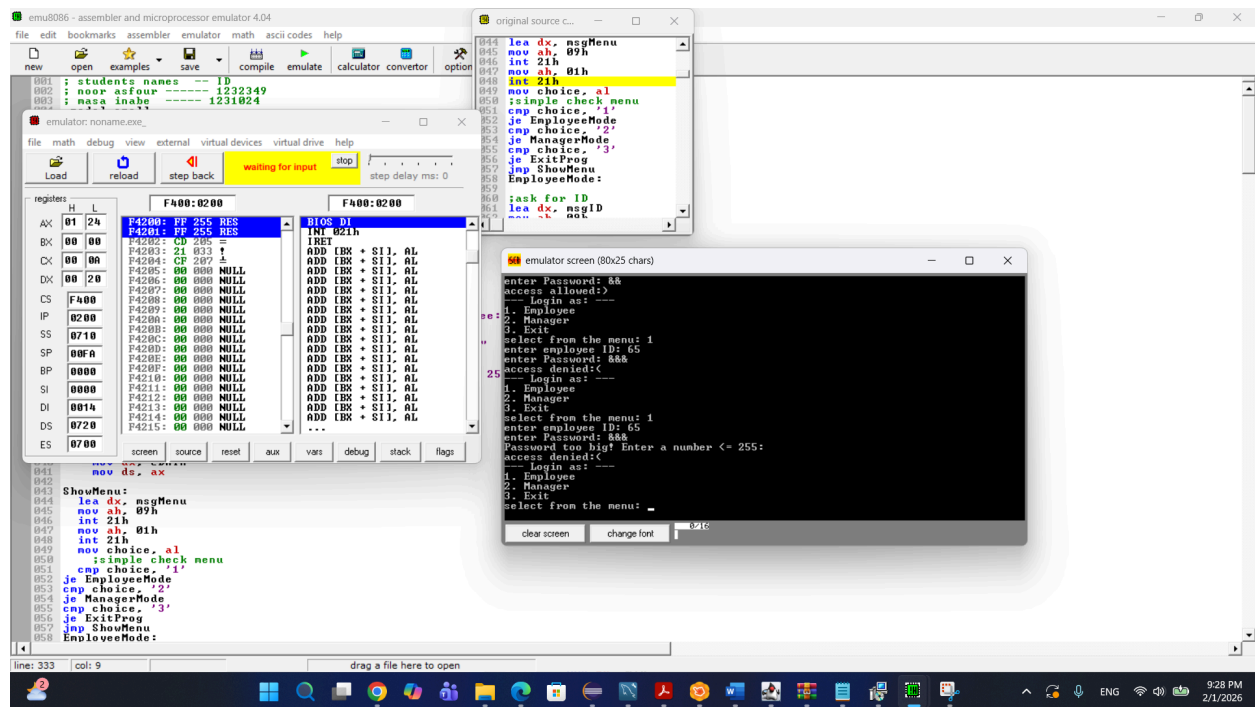

4. In the first case, we entered employee ID 48 with the old password, and the access was denied.

In the second case, we entered the employee ID with new password which is 33, and the access was allowed./

5. When we tried to log in again as employee by writing a password that is greater than 255 (8 bit), it shows that its too big and required entering the password again.

Note: this also happens in manager when entering new password for employee in the manager mode

Work distribution:

In our assignment we have 2 modes manager and employee, both need to apply encryption (as it's described in the assignment description)

Masa - employee part(fully)

Noor - manager part(fully)

Menu part - combined

Encryption logic(shared in both manager and employee by both of us)
